                                                                                                                   The invention relates to isolated polynucleotides (ABZ72147-ABZ42522) of a Streptococcus pneumoniae genomic sequence, a fragment or degenerate variant of the polynucleotide or a nucleic acid sequence 95% identical to one of the polynucleotides. The S. pneumoniae polynucleotides and encoded polypeptides (ABP81299-ABP81674) are useful for treating or preventing S. pneumoniae infections or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae. These are also useful for detecting S. pneumoniae in a biological sample or diagnosing S. pneumoniae in a subject. The polynucleotides have antibacterial activity and are useful in gene therapy
                                                                                                                                                                                                                                                                                       New Streptococcus pneumoniae polynucleotides, useful for treating of preventing S. pneumoniae infections, or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae.

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                              27-FEB-2002
                                                                                                                                                                                                                                                                                                                                                                 AAU43975;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelltis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The copypeptides may be used as antipens in the production of antibodies convergilate expression and activity of P. acnes polypeptides and convergilate expression and activity of P. acnes polypeptides and convergilate expression and activity of P. acnes polypeptides and convergilate expression and activity of P. acnes polypeptides and convergilate expression and activity of P. acnes polypeptides and convergilate expression and activity of P. acnes polypeptides and convergilate agents for determining P. acnes presence, for example, by convergilate agents for determining P. acnes presence, for example, by convergilate agents for determining P. acnes presence, for example, by convergilate activity of the printed specification, but was for this patent did not form part of the printed specification, but was for the printed specification as for the printed specification activity of the printed specification activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

composition and repaired protein. The invention and so relates to comprehensing a propionibatterium acmes protein. The invention also relates to comprehension of proteins of p. acmes polypeptides. The invention and to companie fragments of p. acmes polypeptides. The invention companies of the invention and host cells comprising a polypeptide of the invention; an invention; an invention; an invention; an invention; an invention; an invention; a comprising a polypeptide of the invention; a comprising proteins comprising polypeptide of the invention; a complex comprehension of the invention; a complex comprehension of polypeptide and an isolated T cell population comprising T cells prepared contigen-presenting cells that express the polypeptides, or comprehension of p. acmes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or comprehension of p. acmes in a companient; and a method for inhibiting the development of P. acmes in a companient; and a method for inhibiting the development of P. acmes in a companient, the p. acmes in a comprehens, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acme composition. The polymucleotides can also be used as probes or primers for mucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acmes in a complex companient of the primers for the stimulation of an immune response against p. acmes of the companient of the composition is useful for the stimulation of an immune response against p. acmes of the companient of the companie
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mitcham JL, Skeiky YAW, Ferb

                                                                                                                                                                                                                                                                                                                                    19-JUN-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acids may be used in genetic engineering protocols to transform plants and other eukaryotes e.g. yeast, maize (especially), soybean, beet, tobacco, wheat, barley, poppy, rape, sunflower, alfalfa, sorghum, rose, carnation, gerbera, carrot, tomato, lettuce, chicory, pepper, melc and cabbage. They may be used in this way to confer protection against heterocyclic herbicides, sulfonylurea herbicides, substituted urea herbicides and/or organophosphate insecticides. The present sequence represents the Z. mays CYP72A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecules encoding a Zea mays cytochrome P450 CYP72A1, useful for the production of plants resistant to heterocyclic, sulfonylurea and substituted urea herbicides and organophosphate insecticides e.g. Classic and Pursuit.
                                                                                                                                                                                                                                                                                                                                                                                            ABU24124;

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression to fit the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid concluded acid concluded acid; (2) a host cell containing the vector; (3) an isolated concluded acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense concluded acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a gene in an operon required for required for proliferation, or that has an activity against a biological pathway in which a proliferation-required gene or its gene product that has an activity against a proliferation of compound's activity; (11) a culture compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational cory discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, S. present did not form part of the printed specification, but was obtained content did not form part of the printed specification, but was obtained content directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        06-SEP-2001;

CAPALYTIC ACTIVITY: 2-phospho-D-glycerate = 3-phospho-D-glycerate.

COFACTOR: Binds 2 manganese ions per subunit (By similarity).

PATHWAY: Glycolysis.

SUBUNIT: Monomer (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBUNIT: Monomer (By similarity). SIMILARITY: Belongs to the BPG-independent family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PQ0538; PQ0538.

Science 286:1571-1577(1999).
-!- CATALYTIC ACTIVITY: ATP + L-alanine + tRNA(Ala) = AMP + diphosphate + L-alany1-trNA(Ala).
-!- SUBCELULUAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-II aminoacy1-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Germonline; 139520; -. IT IS NEEDED TO TRANSLATE MRNA WITH A SHORT SHINE-DALGARNO (SD) PURINE-RICH SEQUENCE (BY SIMILARITY).
SIMILARITY: Belongs to the S1P family of ribosomal proteins.
SIMILARITY: Contains 4 S1 motif domains.

Bacteriol. 184:5479-5490(2002).

1- FUNCTION: BINDS MRNA; THUS FACILITATING RECOGNITION OF THE INITIATION POINT. IT IS NEEDED TO TRANSLATE MRNA WITH A SHOR'S SHINE-DALGARNO (SD) PURINE-RICH SEQUENCE (BY SIMILARITY).

1- SIMILARITY: Belongs to the S1P family of ribosomal proteins.

1- SIMILARITY: Contains 4 S1 motif domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       105

"The complete genome sequence of Mycobacterium bovis.";

Proc. Natl. Acad. Sci. U.S.A. 100:7877-7882(2003).

-!- FUNCTION: May be a sulfotransferase involved in the formation of thosquifate (By similarity).

-!- CATALYTIC ACTIVITY: Thiosulfate + cyanide = sulfite + thiocyanate.

-!- SIMILARITY: Contains 2 rhodanese domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    мусво

New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.

Claim 4; Page 29; 37pp; English.

The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region

resent peptide sequence is HPL inhibiting VHH fragment, (camelid) species

n beings.

Sequence 129 AA

```
The present invention describes a polynucleotide (I) comprising a CC sequence of a Biidobacterium genome selected from the nucleotide CC sequences given in ABQ81842 and ABQ81843, or a sequence exhibiting at CC least 90% identity or which hybridises with the sequences given in CC ABQ81842 and ABQ81843. Also described is a polynucleotide (II) encoding a CC in ABBC6258 to ABBC6354 ligated in frame to a polynucleotide encoding a CC heterologous polypeptide. (I) has antidiarrheic and antibacterial CC aprobe) is useful for the detection and/or identification of Bifidobacterium longum in a biological sample. A carrier containing the CC lactic acid bacterium gently creating diarrhoea brought about by pathogenic CC bacteria and/or rotavirus. The carrier is a food composition selected from milk, yogurt, curd, cheese, fermented milks, milk based fermented creams, infant formula, pet food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral supplement, wet oral supplement, dry tube feeding or wet tube feeding. CC expression of the Bifidobacterium gene. ABQ81844 to ABQ81850 represent Bifidobacterium related nucleotide sequences given in the Sequence CC in the princed specification but is based on sequence information. N B. The sequence data for this patent is not represented in the princed specification but is based on sequence information.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 3

                                                                                                                                        The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human baings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Llama antibody; camelid; anorectic; heavy chain variable domain human dietary enzyme inhibitor; medicament; human pancreatic life food; human gastric lipase; HGL; cosmetic control; body weight; complementarity determining region 3; CDR3.
                                                                                                                                                                                                                                                         New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid
                                                                                                                                                                                                                                                                                              WPI;

The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is HPL inhibiting VHH fragment, HPL #22 from llama (camelid) species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 2; Page 10; 37pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antibody; camelid; anorectic; heavy chain variable domain; VHH; dietary enzyme inhibitor; medicament; human pancreatic lipase; human gastric lipase; HGL; cosmetic control; body weight.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Location/Qualifiers
